Job Description

Senior Software Engineer   #MadAboutSoftware

Frontend Specialist

Autoninja is a rapidly growing, venture-funded startup building mobile CRM tools for Auto retailers in India. CRM stands for Customer Relationship Management but means different things in different contexts. In our context, CRM tools help automobile dealerships market their services to prospective customers.

Autoninja is a SaaS company. It means that our software is hosted in the cloud and served on web and mobile front-ends. It also means that we are in the business of selling software, not in the business of selling "things" with software. This difference is crucial. This difference means that we are mad about software; that we care deeply about the software we build. It also means that we are passionate about working with only the best software engineers in this country.

The Role

Software engineers at **Autoninja** are expected to be strong problem solvers with a deep understanding of how to make software modular. If you've ever built a complete application all by yourself, that's a major plus. Most people you will work with at **Autoninja** have done so.

You will also be expected to really understand software architecture. You should be able to imagine the architecture of a new product and make choices even before the spec is ready. Further, you will be expected to train and coach other engineers on the team.

Software development is about expressing logic elegantly – great software engineers are great writers too. Hence, we expect you to have strong communication skills. We are agnostic about your major; some of the best Indian developers we know do not have a CS degree. We strongly believe that great engineers learn to adapt to new technologies in a matter of days.

You Have

- Good Analytical Skills and Problem-Solving Ability
- Strong grasp of core Computer Science Concepts
- Strong Communication Skills
- A Deep Hunger to Learn and Create Technology
- At least 2 years of Relevant Work Experience with React
- Displayed ownership in building end-to-end applications

We Have

- Multiple Cutting-edge Software Products
- A very wide Technology Stack – Python, React, Laravel, PHP, MySQL, Angular, FreeSWITCH, sipML5, Android, iOS, React-native... whew!
- A Great Learning Environment and a lot of Freedom
- Some of the best Engineers to work along
- Best-in-Class Pay and Stock Options

If you are as passionate about great software as we are, we would love to hear from you. Write to us at **info@autoninja.in**
